TASK-6

Week 6 Internship Project Report

InternNova — Responsive Internship Website

1. Project Objective

The objective of this project was to develop a responsive internship website using HTML, CSS, and JavaScript. The project aimed to apply web development concepts, improve user interaction, practise Git version control, and deploy a website using GitHub Pages.

2. Project Overview

InternNova is an internship information website that presents internship programs, available domains, workshops, testimonials, and frequently asked questions. It also includes an application form where users can enter their details and select an internship domain and program level.

3. Technologies Used

- HTML5 for webpage structure and semantic elements.
- CSS3 for styling, the box model, Flexbox, Grid, and responsive layouts.
- JavaScript for DOM manipulation, event handling, interactive elements, and form validation.
- Git and GitHub for version control and source-code hosting.
- GitHub Pages for website deployment.

4. Features Implemented

The website includes a responsive navigation menu, rotating hero text, animated statistics, internship program filters, a testimonial slider, and an FAQ accordion. The application form collects a name, email address, internship domain, and program level. Client-side validation checks the inputs and displays a success message for valid details. The form is a demonstration and does not submit data to a backend server.

5. Version Control and Deployment

The project files were uploaded to a separate GitHub repository to keep the Week 6 work independent of the previous week's project. A README file documents the project's objective, technologies, features, and setup instructions. GitHub Pages was selected as the deployment platform.

6. Challenges and Solutions

One challenge was ensuring that the application form's HTML element IDs matched those referenced in JavaScript. A missing or mismatched element caused a null-value error, which was resolved by correcting the email field's ID. The website was also tested using browser device simulation to check its mobile and tablet layouts.

Additional Testing

During testing, I checked the website at different screen sizes using the browser's device simulation tools. I also tested the navigation menu, program filters, testimonial controls, FAQ accordion, and application form. These checks helped identify issues and confirm that the main interactive features worked as expected. Testing also highlighted the importance of matching HTML element IDs with JavaScript selectors and keeping the code organized.

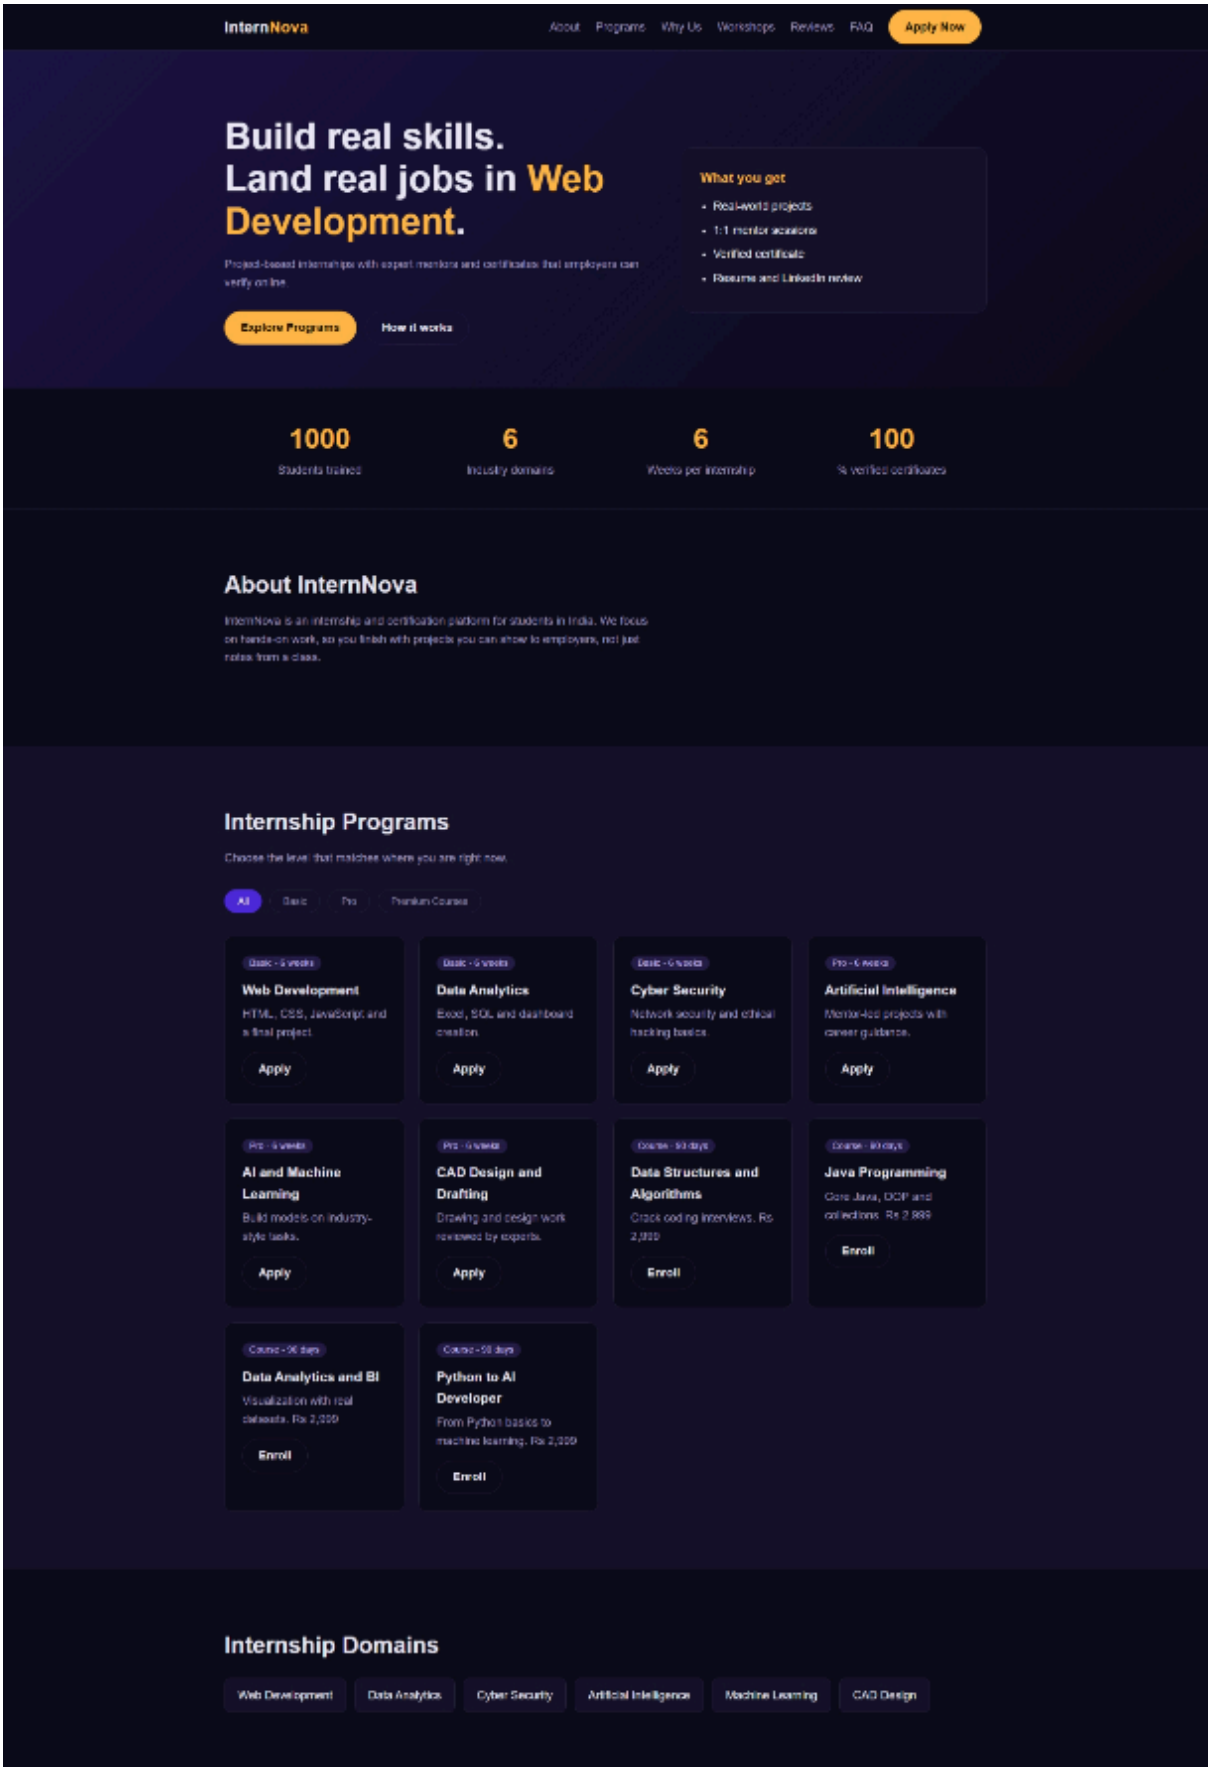

7. Learning Outcomes

This project strengthened my understanding of semantic HTML, responsive CSS, JavaScript arrays, objects, functions, DOM manipulation, and event handling. It also provided practical experience with GitHub repositories, project documentation, debugging, and website deployment.

8. Future Improvements

Future improvements could include connecting the application form to a backend, securely storing applications, adding more internship information, and improving accessibility and automated testing.

SCREENSHOTS:

Why Choose InternNova

Real Projects
Work on tasks based on real industry problems.

Expert Mentors
Get weekly feedback on your actual work.

Verified Certificate
Each certificate has a unique ID employers can check.

Flexible Learning
Study online at your own pace around college.

Learning and Mentorship

Your path from signing up to getting certified.

Step 1: Apply
Pick a program and complete the enrollment form.

Step 2: Learn
Open your dashboard for tasks and learning material.

Step 3: Build
Finish weekly projects with help from your mentor.

Step 4: Get certified
Pass the final review and receive your certificate.

Workshops

Data Structures and Algorithms Workshop
24 Oct 2026, 6:00 PM - Online
Register

Python Data Analytics Workshop
24 Oct 2026, 4:00 PM - Online
Register

What Interns Say

The weekly mentor reviews made my code much cleaner. I finally had a project to show in interviews.

Rohit Kapoor, Web Development
